Experiment -2

Student Name: Priyanka

UID: 23BAI70303

Branch: BE-AIT-CSE

Section/Group: 23AIT_KRG-G1_A

Semester: 5th

Date of Performance: 30 July, 2025

Subject Name: ADBMS

Subject Code: 23CSP-333

1. Aim:

MEDIUM LEVEL PROBLEM:

You are a **Database Engineer** at **TalentTree Inc.**, an enterprise HR analytics platform that stores employee data, including their reporting relationships. The company maintains a centralized **Employee** relation that holds:
Each employee's ID, name, department, and manager ID (who is also an employee in the same table).

Your task is to generate a report that **maps employees to their respective managers**, showing:

The employee's name and department

Their manager's name and department (if applicable)

This will help the HR department visualize the internal reporting hierarchy.

.

HARD LEVEL PROBLEM:

You are a Data Engineer at **FinSight Corp**, a company that models Net Present Value (NPV) projections for investment decisions. Your system maintains two key datasets:

1. **Year_tbl:** Actual recorded NPV's of various financial instruments over different years:
   ID: Unique Financial instrument identifier.
   YEAR: Year of record
   NPV: Net Present Value in that year

2. **Queries_tbl:** A list of instrument-year pairs for which stakeholders are requesting NPV values:
   ID: Financial instrument identifier
   YEAR: Year of interest.

Find the NPV of each query from the Queries table. Return the output order by ID and Year in the sorted form.

However, not all **ID-YEAR combinations** in the Queries table are present in the Year_tbl. If an NPV is missing for a requested combination, assume it to be 0 to maintain a consistent financial report.

2. Objective:

As a Data Engineer, you will generate reports across HR and finance domains. Your tasks include mapping employees to managers for an organizational hierarchy report and retrieving Net Present Value (NPV) figures for stakeholder queries. You must handle missing data, such as defaulting an NPV to 0, and ensure all final reports are properly sorted and structured.

3. Theory:

- This **Joins (LEFT JOIN & SELF JOIN):**
  - **LEFT JOIN** is used to ensure all records from a primary table (like Queries or Employee) are included in the output, even if there's no match in the second table. This is how you kept all requested NPV queries and all employees in your reports.
  - **SELF JOIN** is a pattern for querying hierarchical data within a single table, which you used to link employees to their managers.

- **Keys (PRIMARY & FOREIGN):**
  - **PRIMARY KEY** ensures every row has a unique identifier (EmpID).
  - **FOREIGN KEY** enforces data integrity by making sure a ManagerID refers to an actual, existing employee.

- **Handling Missing Data (NULL & ISNULL):**
  - NULL is a marker for absent information. The LEFT JOIN creates NULLs when an NPV value is not found.
  - **ISNULL()** is a function that applies a business rule by replacing these NULLs with a default value, like 0.

4. Procedure:

1. **Define the Employee Hierarchy Schema**:

    - The script first executes `CREATE TABLE Employee` to define the structure for storing employee data.
    - Immediately after, `ALTER TABLE` adds a self-referencing `FOREIGN KEY` constraint, linking the `ManagerID` column to the `EmpID` column.

2. **Populate the Employee Table**:

    - `INSERT` statements are used to add six employee records.

3. **Generate the Employee-Manager Report**:

    - The first `SELECT` query runs. It performs a `SELF JOIN` on the `Employee` table (using aliases `E1` for the employee and `E2` for the manager) to link each employee to their manager.
    - A `LEFT JOIN` is used to ensure all employees are included in the result, even 'Alice' who has no manager.
    - The query selects the name and department from both aliases to produce the final organizational chart report.

4. **Define the Financial Data Schema**:

    - The script proceeds to create two new tables for the financial task.
    - `CREATE TABLE Year_tbl` sets up the table to store historical NPV data, and `CREATE TABLE Queries` sets up the table to hold the list of stakeholder requests.

5. **Populate the Financial Data and Query Tables**:

    - `INSERT` statements are run to populate both `Year_tbl` with known financial records and `Queries` with the specific `ID`-`YEAR` pairs that need to be looked up.

6. **Generate the NPV Calculation Report**:

    - The final `SELECT` query runs to produce the NPV report. It works as follows:

        - It starts with the `Queries` table to ensure every request is addressed.
        - It uses a `LEFT JOIN` to look up the corresponding NPV from `Year_tbl` by matching both `ID` and `YEAR`.
        - It applies the `ISNULL()` function to replace any `NULL` values (for queries with no matching data) with `0`.

5. **Code:**

```
--Medium Level Problem
CREATE TABLE Employee (
   EmpID INT PRIMARY KEY,
   EmpName VARCHAR(50) NOT NULL,
   Department VARCHAR(50) NOT NULL,
   ManagerID INT NULL
);

ALTER TABLE Employee
ADD CONSTRAINT FK_EMPLOYEE FOREIGN KEY (ManagerID) REFERENCES
EMPLOYEE(EmpID)
INSERT INTO Employee (EmpID, EmpName, Department, ManagerID)
VALUES
(1, 'Alice', 'HR', NULL),
(2, 'Bob', 'Finance', 1),
(3, 'Charlie', 'IT', 1),
(4, 'David', 'Finance', 2),
(5, 'Eve', 'IT', 3),
(6, 'Frank', 'HR', 1);

SELECT E1.EmpName as [EMPLOYEE NAME], E2.EmpName as [Manager Name],
E1.Department as [Employee Dept], E2.ManagerId as [Manager ID]
FROM Employee as E1
LEFT OUTER JOIN
Employee as E2
ON
E1.ManagerID = E2.EmpID
--HARD LEVEL PROBLEM
CREATE TABLE Year_tbl (
   ID INT,
   YEAR INT,
   NPV INT
);

-- Create Queries table (requested values)
CREATE TABLE Queries (
   ID INT,
   YEAR INT
);
```

```
-- Insert data into Year_tbl
INSERT INTO Year_tbl (ID, YEAR, NPV)
VALUES
(1, 2018, 100),
(7, 2020, 30),
(13, 2019, 40),
(1, 2019, 113),
(2, 2008, 121),
(3, 2009, 12),
(11, 2020, 99),
(7, 2019, 0);

-- Insert data into Queries
INSERT INTO Queries (ID, YEAR)
VALUES
(1, 2019),
(2, 2008),
(3, 2009),
(7, 2018),
(7, 2019),
(7, 2020),
(13, 2019);

SELECT Q.ID  AS [ID], Q.YEAR AS [YEAR] , ISNULL(Y.NPV,0) AS [NPV]
FROM Queries AS Q
LEFT OUTER JOIN
Year_tbl AS Y
ON
Q.YEAR = Y.YEAR
AND
Q.ID = Y.ID
```

6. Output:

Results | Messages

	EMPLOYEE NAME	Manager Name	Employee Dept	Manager ID
1	Alice	NULL	HR	NULL
2	Bob	Alice	Finance	NULL
3	Charlie	Alice	IT	NULL
4	David	Bob	Finance	1
5	Eve	Charlie	IT	1
6	Frank	Alice	HR	NULL

Results Messages

	ID	YEAR	NPV
1	1	2019	113
2	2	2008	121
3	3	2009	12
4	7	2018	0
5	7	2019	0
6	7	2020	30
7	13	2019	40

7. Learning Outcomes:

- **Design and model complex data relationships**, including hierarchies using self-referencing FOREIGN KEY constraints to ensure data integrity.
- **Retrieve comprehensive datasets using advanced joins**, such as SELF JOIN for hierarchical queries and LEFT JOIN to create complete reports.
- **Clean and structure query results for reliable reporting** by handling missing data with functions like ISNULL()
